

DESIGN

3.1 Data Architecture & Relational Schema

The structural integration of the Phase 1 architecture relies upon linking core table schemas within the ServiceNow system dictionary database. Data flows cleanly from user catalog entry submission into targeted tracking tables.

[Service Catalog Interaction: Laptop Form]

[Requested Item Schema (sc_req_item)]

▼ (Dynamically populates Data Pills)

[Approval Task Container (sysapproval_approver)]

[STATE: APPROVED]

[STATE: REJECTED]

Proceed to Phase 2

1. Update State to Closed Incomplete

2. Trigger Custom HTML Layout

3.2 Technical Component Specification

The orchestration design is composed of three modular blocks engineered directly within Workflow Studio:

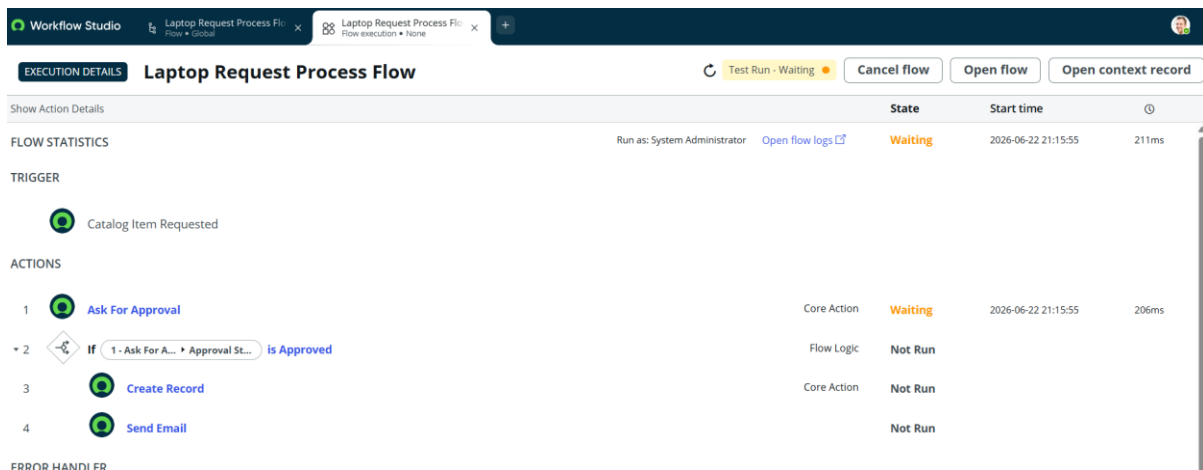

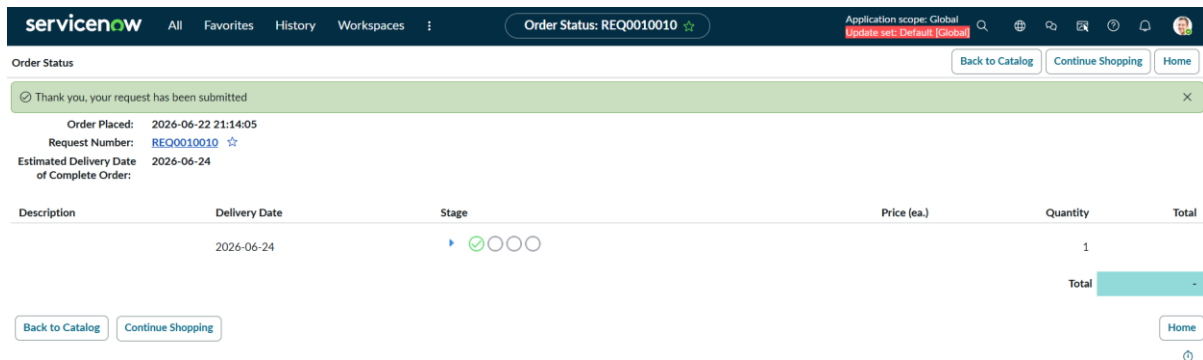

- **The Process Core Trigger**
 - **Configuration:** Watcher script bound to the Requested Item table (sc_req_item).
 - **Logic:** Filters incoming transactional records to execute exclusively when the catalog item ID matches the specific laptop order item form.
- **The Core Approval Node**
 - **Configuration:** System-level process block.
 - **Logic:** Leverages data-pill reference variables to dot-walk (requested_for.manager) and map the supervisor string dynamically into the tracking record.
- **The Conditional Routing Engine** ◦
 - **Configuration:** Runtime evaluation switch.
 - **Logic:** Actively monitors the state string returned by the approval node to fork and manage downstream tracking workflows instantly.

3.3 Interface Communication Layout Design

To avoid unformatted plain-text outputs, the design uses a custom HTML notification structure layout within the execution flow's email block, matching corporate brand layouts.

3.4 Custom Rejection Notification Blueprint

When an item transitions down the rejection pathway, the layout maps explicit system parameters instead of ambiguous text sentences. The interface elements are organized as detailed in the technical blueprint wireframe below:

3.5 Layout Construction Specifications

To ensure modern email client rendering, the layout engine strictly enforces the following semantic markup rules:

- **Header Blocks:** Center-aligned structural layout incorporating the corporate asset banner. The primary status alert uses heavy, bold typography styles to convey processing outcomes definitively.
- **Visual Dividers:** Content domains are isolated cleanly using thin horizontal rule elements (`<hr style="border: 0; border-top:`

1px solid #E0E0E0;"/>) to separate structural details from tracking components.

- **Actionable Elements:** System anchor paths are wrapped inside distinct CSS-styled inline block containers (display: inlineblock; padding: 12px 24px; background: #032D42; color: #FFF; border-radius: 4px; text-decoration: none;), giving users an immediate, high-visibility interactive shortcut to view their ticket history.
